integrins alpha-3 and alpha-5 (By similarity). Cyr61-mediated gene regulation is dependent on heparin-binding (By similarity). Downergulates the expression of alpha-1 and alpha-2 subunits of collagen type-1 (By similarity). Promotes cell adhesion and adhesive signaling through integrin alpha-6/beta-1, cell migration through integrin alpha-1/beta-5 and cell proliferation through integrin alpha-7/beta-3 (By similarity).

-!- SUBUNIT: Interaction with integrins is heparin- and cell-type-dependent and promotes cell adhesion (By similarity).
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: LOW IN KIDNEY, ADDENNAL GLAND, TESTES, BRAIN, AND OWARY, WODERATE IN HEART, UTERUS, AND SKELETAL MUSCLE, HIGHEST
                                                                                                                                                                                                                                                                                                                                                                             -!- DEVELOPMENTAL STAGE: EXPRESSED FROM G(0)/G(1) THROUGH MID-G(1) IN NORMAL CELLS, AND AT A CONSTANT LEVEL IN RAPIDLY GROWING CELLS.
-!- INDUCTION: By growth factors.
-!- SIMILARITY: Belongs to the COW family.
-!- SIMILARITY: Contains 1 IGFBP domain.
-!- SIMILARITY: Contains 1 TSP type-1 domain.
-!- SIMILARITY: Contains 1 TSP type-1 domain.
-!- SIMILARITY: Contains 1 C-terminal cystine knot-like (CTCK) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

I Biol. Chem. 25:2829298036(200).

I Biol. Chem. 25:2829298036(200).

I modulating, in skin fibroblasts, the expression of a number of genes involved in angiogenesis, inflammation and matrix remodeling including VEGA-A, VEGA-C, MMP1, MMP3, TIMP1, UPA, PAI-1 and integrine alpha-3 (By similarity). Cyrci-mediated gene regulation is dependent on heparin-binding (By similarity). Downregulation is dependent on heparin-binding (By similarity). Downregulates the expression of alpha-1 and alpha-2 subunits of collagen type-1 (By similarity). Promotes Cell adhesion and adhesive signaling through integrine alpha-1/beta-5 and cell proliferation through integrin alpha-1/beta-5 and cell proliferation through integrin alpha-1/beta-5 and cell proliferation through integrin alpha-1/beta-5 and cell proliferation through integrine alpha-1/beta-5 and cell shallarity).

I SUBLIMARITY: Contains 1 IGFBP domain.

I SIMILARITY: Contains 1 INFC domain.

I SIMILARITY: Contains 1 INFC domain.

Identification of a phorbol ester-repressible v-src-inducible gene.";
Proc. Natl. Acad. Sci. U.S.A. 86:1178-1182(1989).
-!- FUNCTION: PROBABLE SECRETED REGULATORY PROTEIN.
-!- SUBCELLULAR LOCATION: Secreted (Probable).
-!- SIMILARITY: BY V-SRC.
-!- SIMILARITY: Contains 1 IGFBP domain.
-!- SIMILARITY: Contains 1 TSP type-1 domain.
-!- SIMILARITY: Contains 1 TSP type-1 domain.
-!- SIMILARITY: Contains 1 C-terminal cystine knot-like (CTCK) domain.

"Rattus norvegicus connective tissue growth factor.";

"Rattus norvegicus connective tissue michatractant secreted by the connective tissue michatractant secreted by the connective tissue michatractan and differentiation of chondrocytes (By similarity). Mediates heparinand differentiation of chondrocytes (By similarity). Mediates heparinand differentiation of chondrocytes (By similarity). Mediates heparinand differentiation of chondrocytes (By similarity). Mediates heparincell for and divalent cation-dependent cell adhesion in many cell types including fibroblasts, endothelial and epithelial cells (By similarity). Enhances fibroblast growth factor-induced cells (By similarity).

"Sumilarity: Belongs to the CCN family.

"SIMILARITY: Contains 1 IGFBP domain.

"SIMILARITY: Contains 1 IGFBP domain.

cell adhesion and migration through integrin alphavbeta3, promotes endothelial cell survival, and induces angiogenesis in vivo.";
Mol. Cell. Biol. 19:2958-2966(1999).

-! FUNCTION: Major connective tissue mitoattractant secreted by vascular endothelial cells. Promotes proliferation and differentiation of chondrocytes (By similarity). Mediaces heparinand divalent cation-dependent cell adhesion in many cell types including fibroblasts, myofibroblasts, endothelial and epithelial cells (By similarity). Enhances fibroblast growth factor-induced DNA synthesis (By similarity).

-! SUBUNIT: Monomer (By similarity).

-! SUBUNIT: Monomer (By similarity).
                                                                                                                      -! TISSUE SPECIFICITY: TESTIS, SPLEEN, KIDNEY, LUNG, HEART, AND BRAIN (LOWEST LEVEL IN TESTIS AND HIGHEST IN LUNG).
-! INDUCTION: By growth factors.
-! SIMILARITY: Belongs to the CCN family.
-! SIMILARITY: Contains 1 IGFBP domain.
-! SIMILARITY: Contains 1 TSP type-1 domain.
-! SIMILARITY: Contains 1 TSP type-1 domain.
-! SIMILARITY: Contains 1 C-terminal cystine knot-like (GTCK) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Extracellular matrix, Heparin-binding,

The heparin-binding 10 kDa fragment of connective tissue growth factor (CTGF) containing module 4 alone stimulates cell adhesion.";
J. Endocrinol. 176:R1-R7(2003).
-!- FUNCTION: Major connective tissue mitoattractant secreted by vascular endochelial cells. Promotes proliferation and differentiation of chondrocytes. Mediates heparin- and divalent cation-dependent cell adhesion in many cell types including fibroblasts, myofibroblasts, endothelial and epithalial cells. Enhances fibroblast growth factor-induced DNA synthesis.

Tactors in uterine secretory fluids. Identification as heparin-binding growth flatform in uterine secretory fluids. Identification as heparin-
Tactors in uterine secretory fluids. Identification as heparin-
Educated Mr 10,000 forms of connective tissue growth factor.";

T. Biol. Chem. 272:2025-2028(1997).

I. FUNCTION: Major connective tissue mitcattractant secreted by vascular endothelial cells. Promotes proliferation and differentiation of chondrocytes (By similarity). Mediates heparin-
and divalent cation-dependent cell adhesion in many cell types including fibroblasts, endothelial and epithelial cells (By similarity). Enhances fibroblast growth factor-induced cells (By similarity).

SUBCELLUIAR LOCATION: Found in the extracellular matrix and as a soluble form (By similarity).

SUBCELLUIAR: Contains 1 IGFBP domain.

SIMILARITY: Contains 1 IGFBP domain.

SIMILARITY: Contains 1 TSP type-1 domain.

C. -: SIMILARITY: Contains 1 TSP type-1 domain.

C. -: SIMILARITY: Contains 1 TSP type-1 domain.

WINDLINE-100 and Characterization of xnov, a Xenopus laevis ortholog of the Chicken nov gene.";

Gene 171:243-248(1996).

CI - FUNCTION: Immediate-early protein likely to play a role in cell growth regulation (By similarity).

CI - FUNCTION: Immediate carly protein likely to play a role in cell growth regulation (By similarity).

CI - SUBCELLULAR LOCATION: Secreted.

CI - SIMILARITY: Contains 1 IGFBP domain.

CI - SIMILARITY: Contains 1 TyPP type-1 domain.

CI - SIMILARITY: Contains 1 C-terminal cystine knot-like (CTCK) domain.

"Nephroblastoma overexpressed gene (NOV) codes for a growth factor
that induces protein Lyrosine phosphorylation.";
Gene 238:471-478(1999).
-!- FUNCTION: Can act as a growth factor for some cells and binds to a pecific receptor that leads to the phosphorylation of a 221 KDa
                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rattus norvegicus (Rat).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                              US-09-495-448A-2

ALIGNMENTS

The protein sequence was deduced from the DNA sequence obtd. by screening a cDNA library made from AKR-2B mouse cells induced with TGF-betal and grotochexamide with two probes from untreated AKR-2B mRNA and AKR-2B mRNA from cells treated with cyclohexamide and TGF- betal. The proteins encoded by hybridising colonies (beta-IG-M1 and beta-IG-M2) contain 38 cys residues and are induced by TGF-betal. Beta-IG-M2 displays 80 percent homology to the CEF-10 protein induced by v-src in chicken embryofibroblasts and is identical to the protein encoded by cyrel, an immediate early response gene induced in quiescent BALB 3T3 cells by immediate early response gene induced in quiescent BALB 3T3 cells by serum treatment. Residues 49-56 of beta-IG-M1 conform to the GCGCCXC motif reported in the amino half of insulin-like growth factor (IGF) growth factor beta; induced; CEF-10; v-src; chicken; embryo; TGF-beta. TGF-beta induced gene family - encodes proteins involved in growth and differentiation effects of TGF-beta-1. Chinn J, Neubauer MG; (BRIM) BRISTOL-MYERS SQUIBB CO. binding proteins. The C-terminal Cys rich region of beta-IG-Mi, -M2 and CEF-10 contain an amino acid sequence with strong homology to a motif found near the C-terminal of the malarial circumsporozoite (CS) protein, which is highly conserved among all species of malarial parasites stequenced to date (designated region II). This motif is also found in other proteins which have cell adhesive properties that mediate cell-cell and cell-extracellular matrix interactions, such as propertin, thrombospondin, and TRAP. The proteins encoded by TGF-beta induced genes are likely to be involved in mediation of the biological effects of TGF-beta relating to cell growth and differentiation. See also AAR25566. The invention relates to extracellular matrix (ECM) signalling molecules involved in cellular response to growth factors. More particularly the involved in cellular response to growth factors. More particularly the involved in directed to cysteine-rich protein (Cyrel), and connective rissue such as fibroblast secreted protein (Fright2) and connective rissue growth factor (CTGF) and nucleic acid molecules encoding such proteins. The polypeptides of the invention are members of cysteine-rich secreted protein family. Human Cyrel fragment is useful in methods for screening modulators of cell adhesion, cell migration, fibroblast cell confiferation, angiogenesis, wound healing and Cyrel-integrin receptor interaction. Modulator of Cyrel-integrin alphavbeta3 interaction is used for the preparation of a medicament for the treatment of atherosclerosis, heart disease, tumour metastasis, fibrosis, tumour growth, disorders associated with inadequate angiogenesis; aberrant granulation tissue development; abstrant fibroblast growth and wounds. Polymucleotides of the invention are useful in gene therapy. The present sequence is mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (SCGF). SCGF has vulnerary and osteopathic activities, and can be used in gene therapy. The SCGF polypeptides and polynucleotides can be used for treating muscle wasting diseases, and osteoporosis, and to stimulate wound healing and tissue regeneration, to promote angiogenesis and to stimulate proliferation of vascular smooth muscle and endothelial cell production. The present sequence represents a CNN family protein which is given in comparison with the human SCGF in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method of inhibiting proliferation of uterine lejomyoma or preventing uterine lejomyoma formation. The method comprises increasing the level of Cyr61 in lejomyoma fination. The method invention also describes compounds and compositions that stimulate induction of the Cyr61 gene and compounds that increase Cyr61 activity. The compositions and the method of the invention are useful for preventing uterine lejomyoma formation or inhibiting projection of the invention of the invention of treating or preventing uterine leiomyoma formation of inhibiting projection of uterine leiomyoma formation, or inhibiting proliferation of uterine leiomyoma in a subject. The present sequence represents human Cyr61. Note: The present sequence sequence order in the figure. The start of the sequence is shown on page 8/10 of the figures and the rest of the

cell proliferation by blocking sex steroid induced and growth factor is epidermal, heparin binding epidermal or basic fibroblastic growth factor. (I) can be used to diagnose or stage breast cancer where the level of Cyr61 in a positive/suspect breast cancer where the level of Cyr61 in a positive/suspect breast cancer cell is compared to the level in a normal tissue indicates the presence of breast cancer. The level of Cyr61 being determined by exposing the tissues to (I), and an increase in the level of bound antibody by the suspect/positive cell as compared to the normal tissue indicates the presence of breast cancer. The present sequence represents the human Cyr61 protein, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, angiogenesis, connective tissue growth factor-2; CTGF-2; tumour; ischaemia; restenosis; tissue repair; wound healing; congenital defect; cardiovascular disease, atherosclerosis; heart failure; angina; trauma; burns; osteoporosis; periodontal disease; liver failure; tranquillizer; vulnerary; cosmetic plastic surgery; vasotropic; hepatotropic; ulcer;

                                                                                                                                                                                                                                                                                                                    The present invention describes a method for the prevention or inhibition of breast cancer cell proliferation. The method comprises administration of a compound that inhibits the interaction of a sex steroid receptor with a sex steroid response element of the Cyfol (cysteine rich heparinbinding protein) promoter. Cyfol has cytostatic activity, An antibody (I) which neutralises Cyfol can be used to prevent or inhibit breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Regulation of Cyr61 expression and activity for preventing and inhibiting breast cancer comprises use of a Cyr61 neutralizing antibody, an antisense oligonucleotide and an antibody which.

The present invention relates to a method for stimulating angiogenesis in a mammal. The method comprises administering a polynucleotide encoding connective tissue growth factor-2 (CTGP-2) or an active fragment or its connective. The method is useful for stimulating angiogenesis in a mammal preferably human having is useful for stimulating angiogenesis in a mammal revascularisation which is leg or arm. The invention is useful for limbiting tumour growth, where angiogenesis is utilised for enhancing the repair of connective and support tissue, promoting the attachment, fixation and stabilisation of tissue implants and enhancing wound haling, hence is useful for treating cardiovascular disease e.g. atherosale rosis, reperfusion injury such as heart failure, angina, is chaemia; and is also used to differentiate, proliferate and attract cells leading to regeneration of tissues which is utilised to repair corporate tissue damaged by congenital defects, trauma (burns, ulcer, etc) age, disease (e.g. osteoporosis, periodontal disease, liver failure), surgery including cosmetic plastic surgery. The present

The present invention relates to the isolation of human connective tissue growth factor 2 (CTGF-2), and the polyuncleotide sequence encoding it. The CTGF-2 polypeptide is useful for enhancing the repair of connective and support tissues, for treating skin disorders such as injuries, acne, UV damage or burns, and wrinkled skin, for promoting attachment, fixation and stabilisation of tissue implants, and as an immunogen to produce
                                                                                                                                                                                                                                                              New human connective tissue growth factor 2 polypeptides and polynucleotides useful for enhancing repair of connective and support tissues, and for treating skin disorders, e.g. injuries, acne, UV damage

                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                           antibodies. The polynucleotide sequence encoding CTGF-2 may be used as a hybridisation probe for a cDNA library to isolate the full-length cDNA and other cDNAs, which have high sequence similarity to the CTGF-2 gene or similar biological activity. The polynucleotides are also useful for producing polypeptides by recombinant techniques, and in chromosome identification. The present sequence represents human CTGF-2. Note: The present sequence given as SEQ ID No:2 in the sequence listing differs from that given in Fig 1 (ABU63223)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cancer associated gene; cancer antigen; detection; cancer; diagnosis; cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antitheumatic; antiathritic; antiviral; antinflammatory; antithyroid; antiallergic; antibacterial; cardiant; dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic; antiangiogenic; gene therapy; inflammation; immune disorder; haematopoietic cell disorder; autoimmune disorder; allergic reaction; graft versus host disease; organ rejection; haemostatic; thrombolytic; cardiovascular disorder; infection; neurological disease; drug screening.
